NERC SCIENCE OF THE ENVIRONMENT

# Tools for environmental management

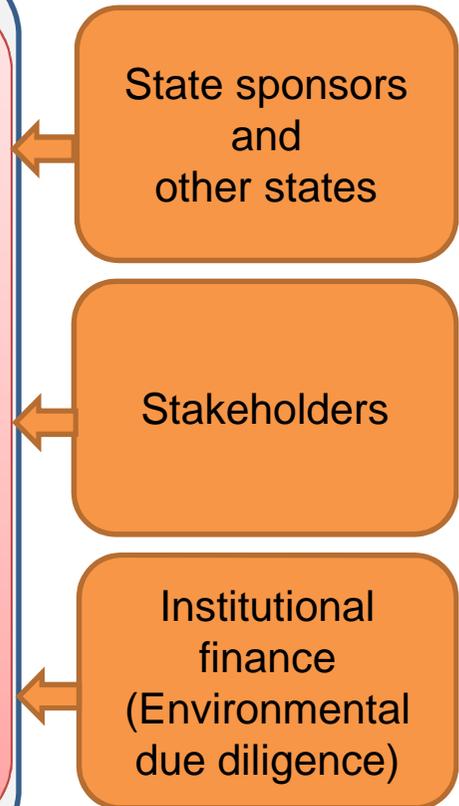

## Management by Regulator

## Management by Contractor

## External assessment

# Strategic environmental assessment

SEA is a systematic decision support process, aiming to ensure that environmental aspects are considered effectively in policy, plan and programme making.

**NERC** SCIENCE OF THE  
ENVIRONMENT

# Strategic Assessment Benefits

Assist ISA in  
managing  
environment  
regionally

Improve strategic  
decision-making

Regional-scale  
understanding

Framework for  
periodic assessment

Anticipate and  
understand  
cumulative or  
combined impacts

Encourages regular  
stakeholder input

Improve data  
consistency +  
exchange

Provide context info  
for project scoping  
EIA, identifies areas  
to focus on

Provides other input  
throughout the EIA  
process

NERC SCIENCE OF THE  
ENVIRONMENT

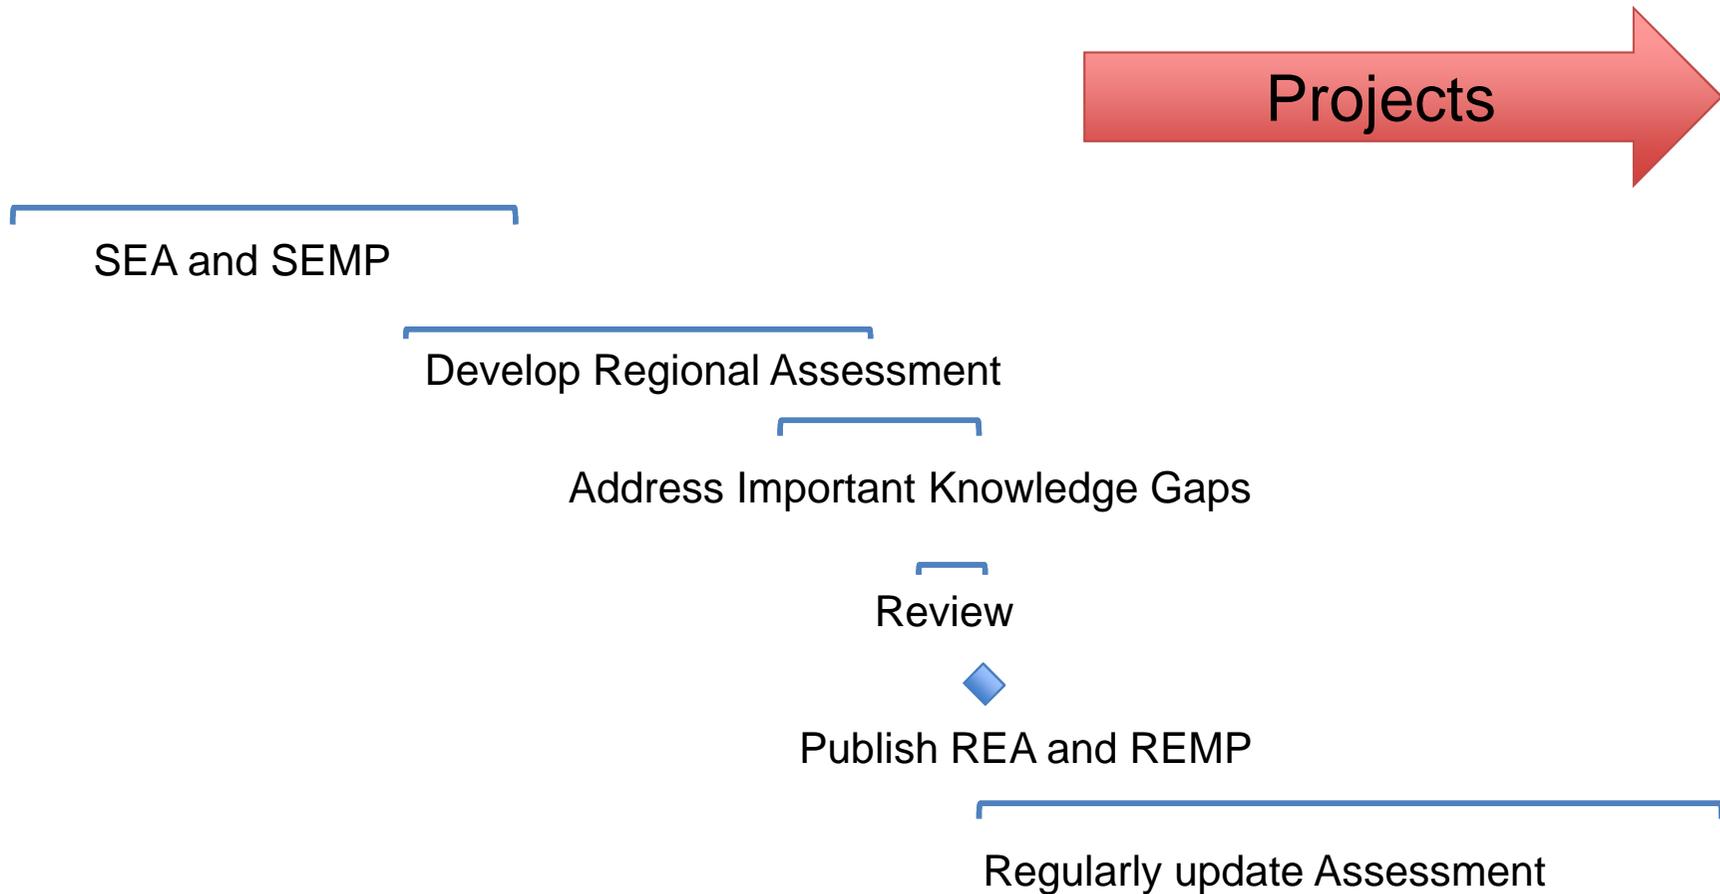

Sets the overall strategy requirements for stakeholders and mode of operation for the whole of the Area

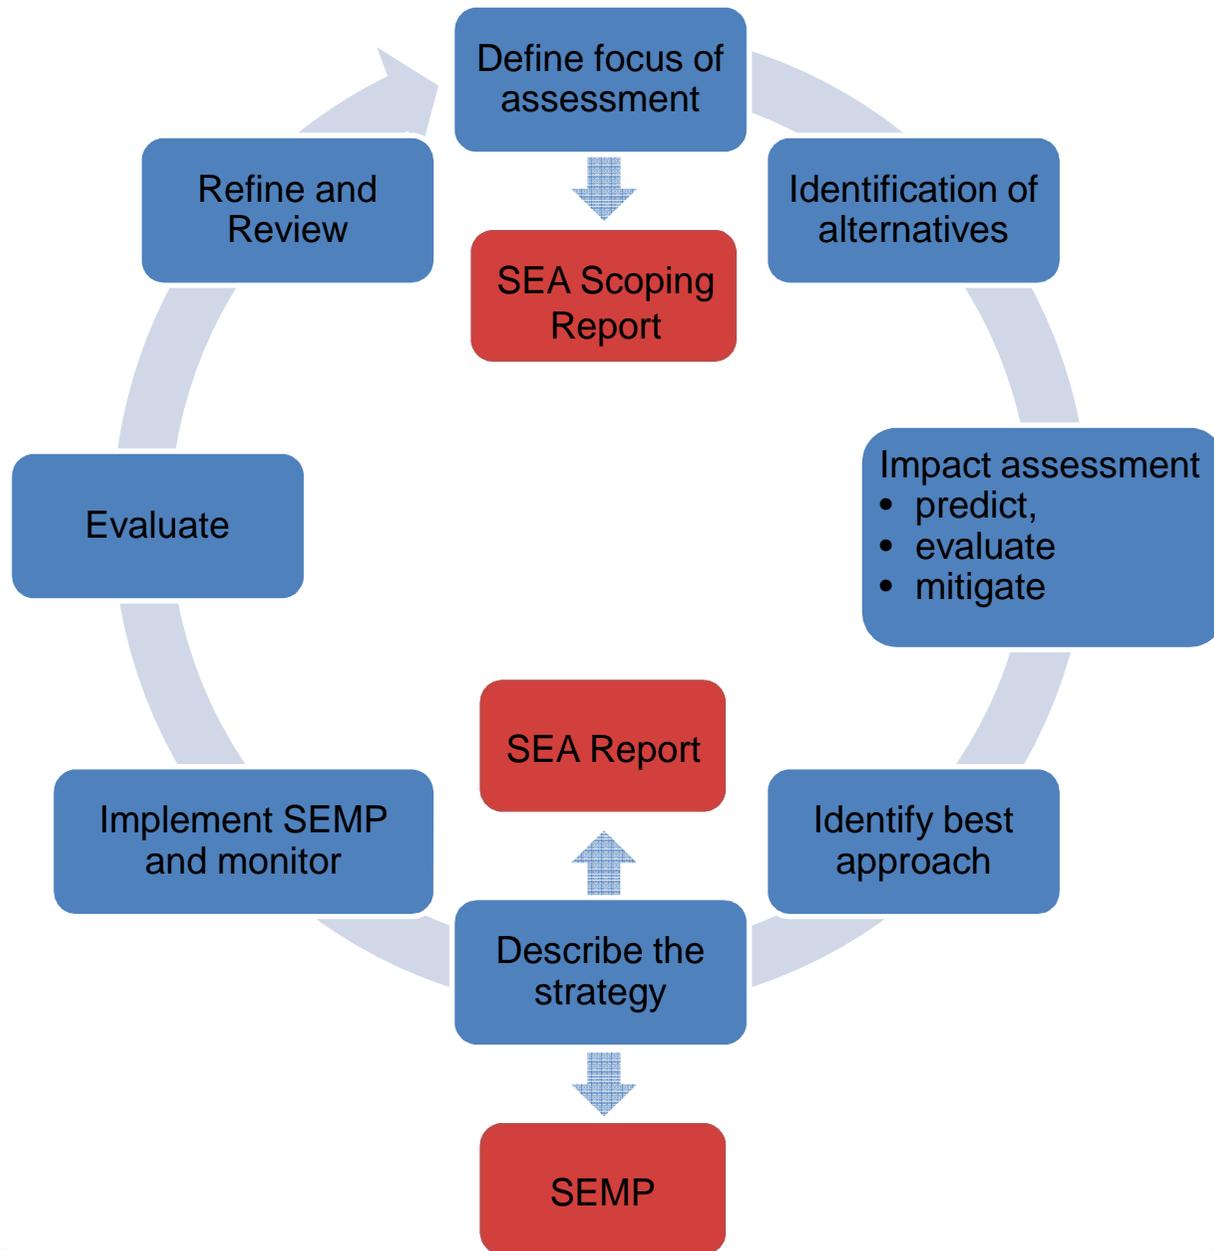

Strategic assessment and plan developed for each region using overarching SEA template

Contractors develop EIAs in line with the regional plan for specific mining projects

# SEA in Environmental Management Process

# Overarching SEA

- Develop an overarching strategic approach for environmental management of deep-sea mining
  - Develop overarching objectives e.g. conservation objectives
- Helps operationalise mining policy
  - Provide a approach for designating project-specific spatial management measures for any exploitation activity
  - Address any generic mitigation strategies
  - Address cumulative impacts
  - Identify relationships with other key stakeholders
  - Technological evaluation
- SEA can be usefully applied only for the activities within the remit of the ISA (in discussion with other stakeholders)

# What is in a SEA vs SEMP

Assessment	Plan
Identify links to other plans / programmes (other authorities e.g. IMO)	Description / Scope
Gather relevant baseline data	Conservation objectives
Identification of key issues	Management objectives e.g. keep water particulate loads < X m <sup>-3</sup> h <sup>-1</sup>
Develop objectives e.g. conservation objectives / management objectives	Environmental management roles and responsibilities
Assessment of alternatives (identification, prediction, mitigation)	Reporting requirements
Assessing cumulative impacts	Outline of key environmental risks / vulnerabilities including cumulative impacts
Assessing uncertainty	Environmental Management Approach / Measures
Stakeholder engagement	Monitoring requirements (to fill gaps)
Decision-making process	What should be done in lower tier assessments
Decision on preferred alternatives	Specific Commitments
	Approach for audit
	<b>REMP</b> Regional baseline description Spatial Management Plan and Maps

# Why do assessment when we only need a plan?

- Documented process provides a clear justification for the plan
- Demonstrates transparency in decision making approach
- Documents uncertainty
- Documents the alternatives considered and basis for rejection
- Provides a foundation for improvement through periodic review
- Captures lessons from process
- Acts as a catalyst for periodic re-assessment of available data

ENVIRONMENT

# Regional Environmental Assessment includes

Strategy

Strategic planning and management focused on region

Leads to development of Regional Environmental Management Plan

Information

Regional-scale environmental information, periodically updated

Regional knowledge base (e.g. mitigation strategies)

Assessment

Regional-scale risk/impact assessment

- Cumulative impacts of mining
- Other anthropogenic inputs (multi-sectoral)

Information from

- Policy
- Contractors
- Independently collected data (possibly commissioned)
- Information from other stakeholders

EIA

NERC SCIENCE OF THE ENVIRONMENT

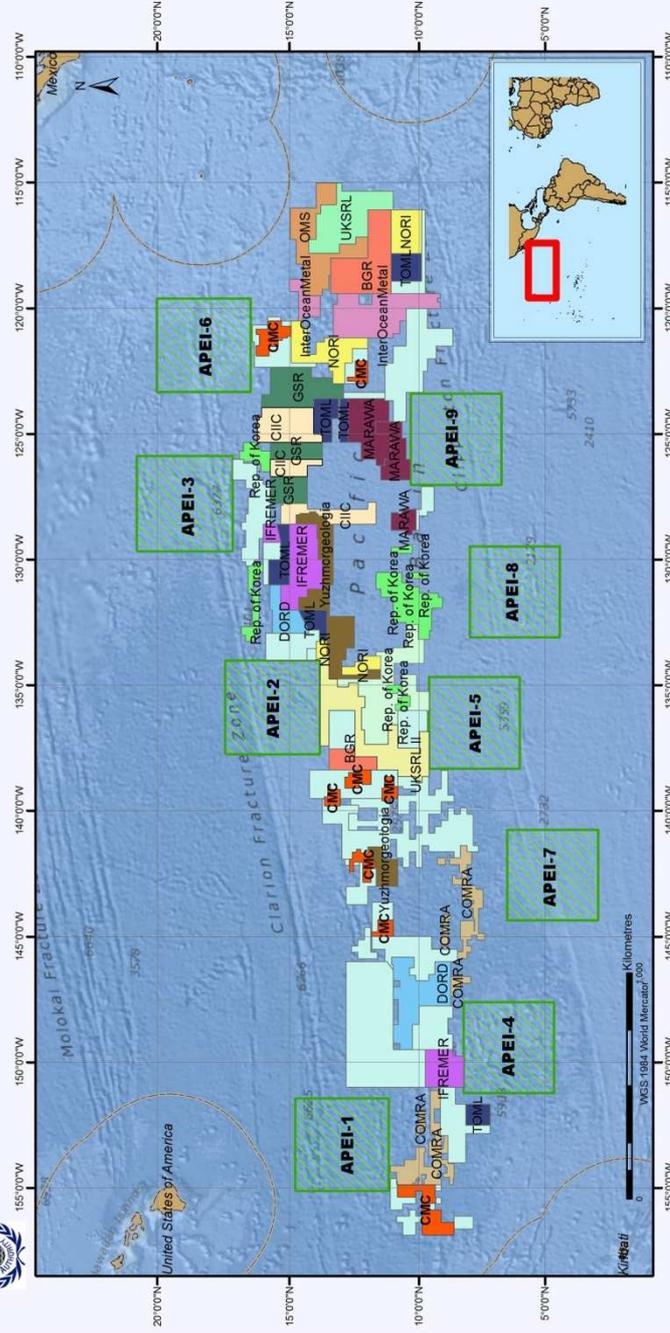

# Regional Env. Management Plan

- Still strategic plan – but regionally focussed
- Higher level than claim-scale environmental management plan
- Typically focusses on spatial management e.g. MPA networks
- Additionally
  - Identify regional priorities for environmental management
  - Identify performance standards or common mitigation approaches
  - Identify baseline / monitoring priorities for region
  - Detail approaches for managing cumulative impacts
  - Identify common vulnerabilities
  - Guide project-based EIA

## Polymetallic Nodules Exploration Areas in the Clarion-Clipperton Fracture Zone

- China Minerals Corporation (CMC)
- Ocean Mineral Singapore Pte Ltd. (OMS)
- Cook Islands Investment Corporation (CIIC)
- Marawa Research and Exploration Ltd (Kiribati)
- Bundesanstalt für Geowissenschaften und Rohstoffe (BGR; Germany)
- China Ocean Mineral Resources Research and Development Association (COMRA; China)
- Deep Ocean Resources Development Company (DORD; Japan)
- Global Sea Mineral Resources (GSR; Belgium)
- Reserved area\*
- Area of particular environmental interest (APEI)\*\*
- Exclusive Economic Zones

\* In the case of polymetallic nodules, the so-called parallel system provides that each application for exploration by a developed State must cover two parts of "equal estimated commercial value". One part is allocated to the applicant and the other is to become the reserved area, which is set aside for the conduct of activities by the Authority or developing States.

\*\* In July 2012, the Authority adopted an environmental management plan for the Clarion-Clipperton Zone to be implemented on a provisional basis over an initial three-year period. The plan includes the designation of a network of areas of particular environmental interest (ISBA/18/C/22).

# Suggestions

Begin S/REA as soon as possible

Use a formalised (and documented) process for S/REA – not just going straight to SEMP/REMP

Stimulate scientific intercomparisons and regional assessments

Consider approaches for S/REA: legal, financial, technical

Encourage collaboration with other regional stakeholders

ENVIRONMENT

# Issues

1. How can the SEA process be integrated into the practice and policy of the ISA?
2. What should be the timeframe for strategic initiatives (SEA and multiple REAs) to be developed?
3. How will the SEA process best link with EIA and claim scale activities?
4. How can the evidence base that underpins SEA be collected and openly shared?
5. What is the minimum amount of data required to perform an REA
6. Should the focus be solely on spatial environmental management approaches?
7. How can SEMP and REMP be made legally binding, particularly after contracts are issued?
8. Who will conduct SEA / REA and how will they interact with the ISA and other stakeholders?
9. How should the development of SEA / REAs be funded? Who should fund baseline data collection and who should fund monitoring?

10. What happens if SEA identifies management strategies that affect mining claims e.g. limits being put on the total amount of mining in a region?
11. Which are the priority areas for establishing REAs and what scale is most appropriate (e.g. do we need more than one for the CCZ)?
12. Should specifically tailored SEA / REA guidance protocols be developed for the ISA?
13. What mechanisms should be established for revision of REMP's and their relationship to adaptive management? What should be the frequency of SEA / REA review and how will the effectiveness of the SEA/REA measures be determined?
14. How can the effects of cumulative impact be taken into account?

# Summary

- Process: SEA (of which REA is a part)
- Output: Strategic and Regional environmental management plans
- Tiered – SEA, REA, (EIA)
- Should be tied to claim-scale management
- Useful and widely adopted approach
- Considered best-practice
- Many issues for DSM
