Update on Financial Payment Systems: Seabed Mining for Polymetallic Nodules

International Seabed Authority
Council Meeting – Kingston, Jamaica
July 16, 2018

Richard Roth & Carlos Munoz Royo
Research Team: Randolph Kirchain, Frank Field and Thomas Peacock
Agenda

• Decision Analysis Framework & Review of Cash Flow Approach
  • Review of seabed nodule mining
  • Outline the decisions facing the ISA
  • Cash flow approach
  • Goals for dividing up the revenues
  • Payment mechanisms (ad valorem, after-tax profit,...)

• Techno-economic modeling updates
  • Revenues: metals price estimation updates
  • Consideration of other metals
  • Cost modeling: collection/transport & metals processing

• Example Results: NOT FINAL

• Impact of Seabed Nodule Supply on Metals Prices
• Response to Comments from March Council Meeting
• Next Steps
Decision Analysis Framework & Review of Cash Flow Approach
## Decision Classifications

### Seabed Management Decisions
- Financial decisions
  - Levels of compensation
  - Mechanism of payments
  - Rates or other parameters
- Regulatory decisions
  - Which areas to be mined
  - Under what conditions?
    - Environmental and otherwise
- Monitoring & enforcement decisions
  - Monitoring requirements for operators
  - Independent monitoring by ISA or others
  - Remediation mechanism when out of compliance

### System Evaluation Decisions
- Which analyses should be conducted?
- What additional information is needed
- Additional assumptions that might be needed

### Today’s focus
- Financial Management Decisions?
  - However, this is somewhat impacted by both regulatory & monitoring decisions
- Analysis needed to support those decisions
Assessment requires understanding the mining & refining processes

- Transport
- Lift/Platform/Process Water
- Nodule Collection
- Metallurgical Processor
  Separate the four metals

Each of these activities require:
- upfront investments
- ongoing operating expenditures
ISA Oversight Only Related to Collector Activities

Modelled Collector

Modelling assumes that ISA royalties are only based on activities at the collector

"At-Sea" Cash Flows Basis for Understanding ISA Decisions

Investors will only take on project if discounted future revenues are large enough to provide a return on their investment that is competitive with other investment opportunities.

All cash flows need to be **discounted** to account for time value of money
(One dollar today is worth more to me than one dollar in the future)
How should revenues be shared?

Investors will only take on project if discounted future revenues are large enough to provide a return on their investment that is competitive with other investment opportunities.

Need to offer the contractors enough revenues to make it worthwhile and to attract investors. Financial institutions/other investors require higher rates of return for projects with higher levels of risk.
How should revenues be shared?

- Revenues from Sale of Nodules
- Operational Expenditures
- Cost of Site Restoration
- ISA Decision Points
- ISA
- Environmental Funds
- Contractors
- Prefeasibility & Feasibility Expenses
- Upfront Equipment Investments
- Expenditures
- Revenues
How should revenues be shared?

- Revenues
  - Revenues from Sale of Nodules

- Expenditures
  - Upfront Equipment Investments
  - Operational Expenditures
  - Cost of Site Restoration
  - Prefeasibility & Feasibility Expenses
  - Environmental Funds
  - Contractors

ISA Decision Points
- Revenue sharing
- Operating requirements
How should revenues be shared?

Expenditures

- Prefeasibility & Feasibility Expenses
- Upfront Equipment Investments

Revenues

- Environmental Funds
- Contractors
- ISA

Operational Expenditures

- Revenues from Sale of Nodules

ISA Decision Points

- Revenue sharing
- Operating requirements
- Contract Duration & Timing
Impact of Contract Timing & Operating Conditions

• ISA Contract Timing Decisions:
  • Specifications about **contract duration** will affect years of revenue & costs and directly impact cash flows
  • Exploitation & Exploration **one-time and annual license fees** must be included in cash flows

• Operating Conditions Decisions:
  • ISA **monitoring** requirements of contractors will impact Upfront Investments & Operating Costs
Revenue Sharing

• Why is it necessary?
  • Formally collectors will receive the money from sale of nodules
  • ISA should receive some of these funds to compensate for the transfer of ownership of the nodules
  • May want some funds set aside for environmental contingencies

• How much money should go to each?
  • ISA will want to maximize its revenue
    • Cover expenses
    • Distribute to member states
  • Sufficient revenues need to go to collectors to incentivize risky investment
  • How much should be set aside for environmental contingencies?
Revenue Sharing Decisions for ISA

• Unlikely that ISA would decide an absolute level of revenues it will receive

• More likely, ISA decisions will concern:
  • Payment schemes to be used to transfer revenues from collectors to ISA & environmental contingency funds
    • Ad Valorem (royalty on the value of metals in the nodules)
    • After-tax Profits
  • Rates to be used in each scheme
  • Measurement Details
    • Ad Valorem: Gross Value at Mouth of Mine? Other?
    • After-Tax Profits: Accounting rules for measuring profit
How large should the contractors share be? What rate of return will be needed to attract investment?

**Nearly Guaranteed Investment** (for example: Gov’t bonds) → **Very low returns required** (0% - 3%)

**Land based mining** → **Moderately high returns required** due to price & geological risk (typically above 15%)

**Seabed mining** → **Higher returns than land based mining**
Same risks, plus technological risk
Never been done at scale before
Banks may be unwilling to provide loans

**Highly Speculative Venture Capital** (Angel investments in new tech) → **Very high returns required** (sometimes well in excess of 100%)
Each set of revenue sharing decisions should be evaluated on the following basis:

**International Seabed Authority:**
- **Average Annual Revenue**
  - Cash flow to CHM in an average or typical year
- **Net Present Value (NPV)**
  - Discounted sum of all revenues to CHM

**Contractors:**
- **Internal Rate of Return (IRR)**
  - Formally it’s the discount rate for future cash flows that gives a zero NPV
  - Practically, it’s used as a measure of the lifetime financial return on upfront investments

**Environmental Fund:**
- **Rate and Total Value of the Fund**

This requires estimating all of the data in the cash flow model:
- Costs
- Revenues
- Licenses, Fees, etc
Techno-Economic Model Updates
Forecasting Revenues: Market for Nodules

• Predicting future revenues would require forecast for nodule prices
• Currently no market for nodules, so difficult to directly assess
• Nodule prices should reflect prices of underlying metals
  • Price metals processors will pay for nodules depends on:
    • The prices they expect to obtain for the metals after extraction
    • The costs of metals extraction: operating expenses plus return on capital investment

• Metals processing cost models can be used to translate metals price forecasts into nodule price forecast
Approach to Price Forecasting with Uncertainty: Statistical methods vs. Expert opinions with stochasticity

- Time series models were developed based on 100 years of historical data (35 years for Mn submarkets)
- These models do not consider structural changes to market (particularly important for Co)

- Instead, use expert long term forecasts for each metal
  - Wood Mackenzie, CRU, SNL, Consensus
- Add stochastic variable as determined by historical trends in price variation

**Purely Statistical Copper Forecast:** ~$5,000/t

**Expert Copper Forecast with Stochasticity:** ~$6,800/t
Expert Prices Forecasts with Uncertainty

- Expert long-term forecasts from numerous mining consultancies
- Auto-regressive random walk uncertainty models

\[ P_t = Int + AR_1 (P_{t-1} - Int) + \varepsilon \]

\( Int = \text{Long Term Price}, \ AR1 = \text{Reversion to mean}, \ \varepsilon = \text{uncertainty} \)

- Gold
- Palladium
- Rhodium
- Platinum
- Silver
- Indium
- Hafnium
- Niobium
- Rubidium

PPB of Nodule Mass
Is there value being missed? Certainly some interesting targets

- Some of the metals in the nodule have very high prices when extracted to high purity
- But concentrations are low
- Five interesting cases
  - Thallium
  - Rubidium
  - Other Rare earth elements + yttrium
  - Titanium
  - Precious
Added value for selected cases

• Amount available refers to the mass present in 3Mt of nodules processed by one
Converting Metal Prices Forecasts to Nodule Prices
No single approach to metallurgical extraction

• Three main classes of processes for main extraction of metals. These often yield three metals (Cu, Co, Ni), but in some cases could yield Mn
  • Leach & Electrowinning (“Cuprion” type processes)
  • Smelt & Leach
  • All Leach

• Two main approaches to additional extraction of Manganese from tailing of three metal processes
  • Smelting: usually for Ferromanganese alloys
  • Leach & Electrowinning: for higher quality EMM

Estimating nodule price:
1. For each stochastic set of metals prices
2. Determine overall metals processor cash flows using the estimated OPEX & CAPEX
3. Assume an IRR required by metals processor
4. Calculate nodule price series (over time) that results in the required IRR
Initial Cost Estimates for Collection/Transport

- Constructed detailed process based cost model for all collection & transport activities
- Obtained data from variety of sources
  - Contractor surveys & discussion
  - Literature
  - Similar industries
- Updates ongoing

Example Results

NOT FINAL
How should revenues be shared?

- Revenues from Sale of Nodules
- Operational Expenditures
- Cost of Site Restoration

Expenses:
- Upfront Equipment Investments
- Prefeasibility & Feasibility Expenses

 ISA Decision Points:
- Revenue sharing
- Operating requirements
- Contract Duration & Timing

Revenues:
- Environmental Funds
- Contractors

ISA
Key Baseline Assumptions

• Timing
  • Pre-feasibility = 6 years, Feasibility = 3 years
  • Design & Build = 3 years
  • Ramp-up = 2 years
  • Full operations = 23 years
  • Shutdown = 1 year

• Ad Valorem rates apply to Gross Value at Mouth of Mine

• After tax profits require detailed accounting rules
  • Used DB depreciation scheme for fixed costs

• Nodule transfer price estimated from value of metal and processor costs

*CAPEX and OPEX values determined from cost models. Metals prices determined from price forecasting models
Example results without uncertainty:

Potential Impact of Seabed Nodule Mining on Metals Prices
How Might Seabed Mining Alter the Metals Markets?

• For this phase of work, VERY SIMPLE analysis
  • Where does seabed mined metal fit into the supply curve today?
  • If one seabed operation was scaled up TODAY, how would it effect the price?
  • Does NOT consider changes in demand in response to that change in price or change in other suppliers behavior in response to that price

• Where does seabed mined metal fit into the current supply curve?
  • This answers the question: Is seabed produced metal competitive on the market today?
  • If one seabed operation was scaled up TODAY, how would it effect the price?
    • This answers the question: How sensitive is the market to new entry

• Initial conclusions for Cu and Ni, continuing work on Co and Mn
Case 1: Copper
One seabed operator would have little impact on price

- Seabed costs sit in the lower third of the current supply curve
- The copper supply curve is very steep near the prices it currently clears at
- Even though one seabed operation might only add 1% to supply, it could cause prices to drop by more than 1%
- However, demand continues to rise. So effect would be smaller.
Case 2: Nickel
One seabed operator could have small impact on price

- Seabed costs sit in the lower third of the current supply curve
- Average nickel supplier (excluding Norilsk), produces about 20kt, one seabed operation may generate 40kt/y (about 2% of primary supply)
- Supply curve is VERY steep in clearing region, so small additions can effect price, but...
- Demand is expected to rise

2017 Ni Cost Curve

2018 Price = ~650

Next Steps
Recommended Additional Work

• Further exploration of polymetallic nodule mining
  • Further refinement of costs & metals price forecasts
  • Transparent collaboration with ISA working group
    • Establish complete set of decision variables
    • Evaluate key scenarios (to be decided in conjunction with working group)

• Understand how seabed nodule mining might affect metal prices and the economies of land based mining countries
  • Expand on initial comparisons with land-based mining cost curve
  • Suggest dynamic supply/demand models for all relevant metals
  • Evaluate impacts by country

• Assessment of environmental costs/benefits
  • Should be collaborative with marine environmental science experts

• Address other seabed minerals
  • Hydrothermal vents & cobalt rich crusts
  • Should similar revenue sharing mechanisms be considered
  • What rates are most appropriate given the economics of each mineral system
